

SyriaTel Churn

By Jared Lilly

Objective

Tasked with predicting **churn** of customers for our telecom company

WHY?

- Saves the company money
- Potentially develop strategies to retain at risk customers

About the Data:

Kaggle dataset containing **3333** rows of SyriaTel customer information and **21** columns

Includes information such as:

- Total day minutes
- Voicemail/international plans
- Total evening minutes etc
- State their from etc.

Models Used/ Data Limitations

Models ran:

Logistic Regression

Decision Tree Classification

Random Tree Classification

Pruned Decision
Tree Classification

Limitations:

Sample Size and Class
imbalance:

Did not churn: 2831

Churned: 483

CHURN HURTS

Model Evaluation:

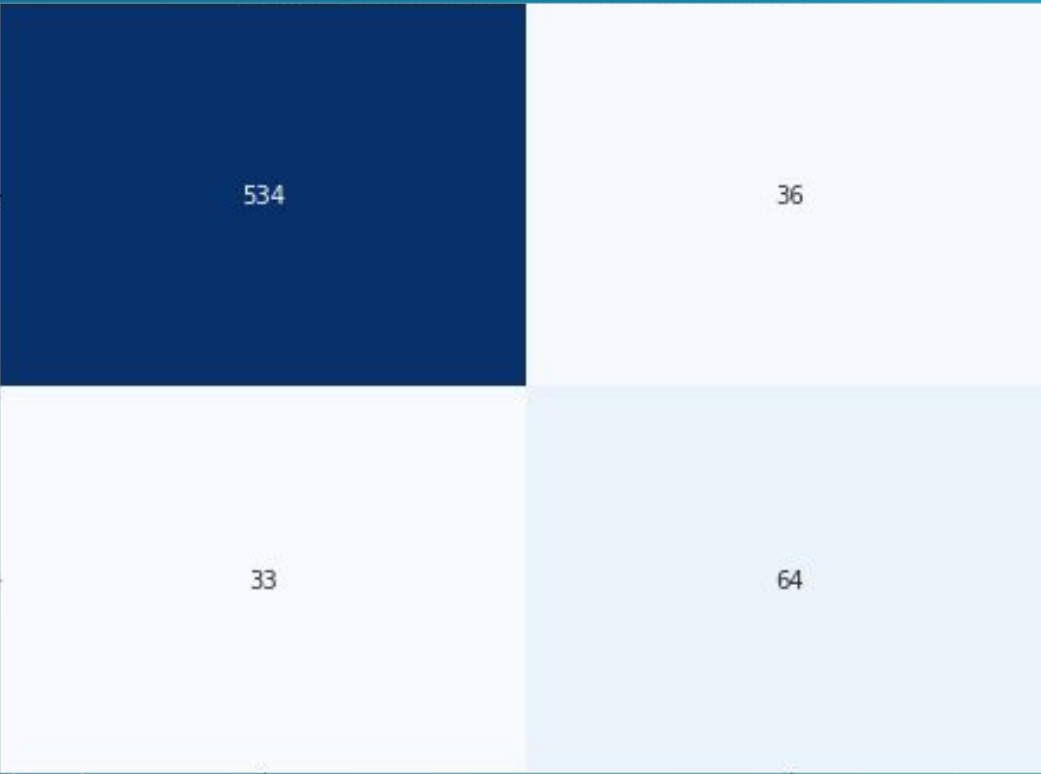

Pruned Decision
Tree:

Recall was
overall best
at **76%**

Why Recall?

Focuses on
correctly
identifying
customers
who might
churn

Pruned Decision Tree - Confusion Matrix

Actual \ Predicted	Not Churned	Churned
Not Churned	534	36
Churned	33	64

Recommendations/Next steps:

Use this model to **save** company money

Focus retention efforts on features:

total day minutes

customer service calls

international plan

THANKS!
